[ALIF CAGE]

The ALIF cage implant is produced from PEEK material, a thermoplastic solution compatible with the body and causes no artifact. Completely compatible with MRI for in-vivo applications. The cage system is also available in forms of; rigid, bladed, expandable and bladed expandable alternatives.

The ALIF cage provides solid interbody fusion with optimized anatomical position. The ALIF cage design offers a large contact area, optimizing vertebral body support while minimizing risk of subsidence.

The large graft window provides maximum biological coverage area, enhancing the opportunity for successful fusion.

Instrumentation offers ease of implementation for surgeons, while unique tooth pattern minimizes the potential of expulsion.
